

The demo page

`pptonpage-demo.html` is a single 1.1 MB file — download it, double-click it, done. The viewer bundle is inlined and the sample deck is embedded as base64, so it renders with **no server and no network**. I tested it over `file://` with every non-file request blocked: 0 outbound requests, 0 page errors, 5 slides rendered.

It's built to actually demo with:

- **Live attribute toggles** — flip animations, autoplay, loop, controls, click-advance, theme and watch the deck respond
- **Event log** — every `pptx-*` event streams in with its payload, which is the easiest way to show the API is real
- **Open your own .pptx** — file picker or drag-and-drop onto the slide; nothing is uploaded

Two component changes were needed to make that work:

`loadBuffer()` — a new public method that renders an `ArrayBuffer`, `Blob` or `File` directly, skipping `src` and `fetch()` entirely. Without it a `file://` page can't load a deck at all, since the `fetch` hits an opaque origin. It's also the right API for anyone with a file input or bytes already in hand, and it has no CORS requirement.

Click-ahead no longer drops presses. I found this while testing: pressing forward during a running animation was silently ignored, so 14 clicks only moved two slides. PowerPoint treats a forward press mid-build as "skip to the result", and it now does the same — the in-flight animations snap to their end state instead of the input vanishing.

Regression suites (`visual.mjs`, `autoplay.mjs`) pass unchanged, and mobile at 390 px has no overflow.

Deployment guide

`DEPLOYMENT.md` covers three topologies (Flask-serves-everything, Flask + CDN, static-only), gunicorn and systemd units, nginx config, Docker, [Fly.io](#), S3/CloudFront with the CORS caveats, three private-deck patterns, a curl verification checklist, and a troubleshooting table. One bug surfaced while writing it: the deck-index JSON omitted the blueprint prefix when the prefix was passed to `register_blueprint` — fixed and re-verified.

Everything is saved to the project and the preview above is running the updated build. Want me to keep iterating on it, publish it to a `pplx.app` link, deploy via the Vercel connector, or open the app to share it?
